Data Visualisation planning

Plan:

1. Make a line graph to represent a data
2. The graph should use two lines data comparison
3. Two different data will be presented to the viewer
4. Make buttons that transfer between data within the same HTML page
5. Make some design to attract the viewer to the data

Accomplishment:

I have been able to find a good online library to show my data with and use it. I used the HTML to create one single page that all data will be shown in. I used the library with more Javascript to enter my data. Also i made two separate data that shows development of topic during two time period that been specified for viewers. Which allow viewer to make comparison between those years and come up with a conclusion regarding the topic. Use some CSS to style the buttons been used to transform from data into another. The source for the library been used to create the graph been added into a file named source to credit the creator.
